

Netflix Content Analytics Project

One_Page_Summary_Report

Prepared by: Rita Effiong Edet

Project Overview

This project analyzed the Netflix Titles Dataset using Python (Pandas, Matplotlib) for data cleaning and exploratory data analysis (EDA), and Power BI for dashboard development. The objective was to explore Netflix's content library, identify trends in movies and TV shows, analyze content distribution across countries and genres, and present the findings through an interactive dashboard.

Cleaning Challenges Encountered

During the data cleaning process, several challenges were identified and resolved:

- Missing values were found in columns such as Country, Director, and Cast.
- Missing values in the Country column were replaced with "Unknown" to preserve all records and avoid losing valuable information.
- The Date Added column was converted to datetime format to support yearly trend analysis.
- The dataset was checked for duplicates and consistency before being exported as a cleaned CSV file for Power BI.

Key EDA Findings

The exploratory data analysis revealed several important trends:

- Movies dominate Netflix's catalog, accounting for approximately 72% of all titles, while TV Shows make up about 28%.
- The United States is the leading content-producing country, followed by India and other international markets.
- Netflix experienced rapid growth in content additions between 2016 and 2020, reflecting a period of significant platform expansion.
- TV Dramas, Documentaries, and International Movies are among the most common content categories.
- The platform offers a diverse catalog with content from many countries and multiple audience ratings.

Top Insights

- ❖ Netflix's content library is primarily focused on movies.

- ❖ The platform has a strong global presence, with content originating from many countries.
- ❖ International content plays a significant role in Netflix's catalog.
- ❖ Interactive dashboards created in Power BI make it easier to understand content trends and support data-driven decision-making.
- ❖ Combining Python for data preparation with Power BI for visualization provides an efficient workflow for analyzing large datasets.
